Title: Importing and exporting data from Access, Make-Table & Union Queries.

Objective:

Sometimes you start out with a small table in Excel and before you know it, your dataset gets so large that it becomes more manageable if you turn it into a database. This is why it can be useful to import Excel sheets into Access.

Inlab Tasks:

Task 1:

Set the primary key of the Customer table.

You then get a blank screen, where you will type in the SQL code for the union query.

Type in the following:

```
SELECT Query1.* from Query1 UNION
```

```
SELECT Query2.* from Query2 UNION
```

```
SELECT Query3.* from Query3
```

This will combine all the fields in each of the three queries into one query. Run your query.

Now that we have the union query, we could either make a new table out of it or append it to an existing table.

Design View:

Field Name	Data Type		
Lastname	Short Text		
Job_Code	Short Text		
Customer_Salary	Number		
Year	Date/Time		

DataSheet View:

PROFILE	Query2	Query4	QUERY

Post Lab Tasks:

Task 1:

Design this table in the access and export it to the pdf file.

ID	FirstName	LastName	Job_Code	Salary	Contact
1	Dia	Haroon	XTY76	23640	344985550
2	Daniyal	Quddoos	NY54	3275	330473570

Task 2:

Design a new table “Profile” from above table “Employees” including fields LName,JobCode and Salary using make table query.

The screenshot shows the Microsoft Access interface. At the top, a table design view for a table named 'PROFILE' is visible. It has three fields: 'lastname', 'jobcode', and 'salary'. The 'salary' field is highlighted. Below the design view, the 'MakeTableQuery' dialog box is open, showing the 'Field:' list with 'lastname', 'jobcode', and 'salary'. The 'Table:' is set to 'PROFILE'. The 'Show:' checkbox is checked for all three fields. The 'Criteria:' and 'or:' sections are empty.
